KORZION · PROJECT PROPOSAL

Ondos – A Maze Game

Glove-Controlled Labyrinth with an AI Solver

THE PROJECT

Ondos is a real maze game you play with your hand. You wear a glove and tilt your hand, the maze tilts with you, and you roll the ball to the exit.

A camera follows the ball, and the computer shows every game in 3D with live graphs. Then an AI learns from the games people played and solves the same maze by itself.

Game flow

1 • Setup

The maze is placed on the platform. The camera reads the walls, the start and the exit.

2 • Start

On the control station, the user selects player mode or AI mode and starts the game.

3 • Playing

Player: the hand tilts the maze through the glove.
AI: the AI decides the tilt from the ball position and the path.

4 • Monitoring

The 3D model and live graphs update. Settings can be changed, and there is an emergency stop.

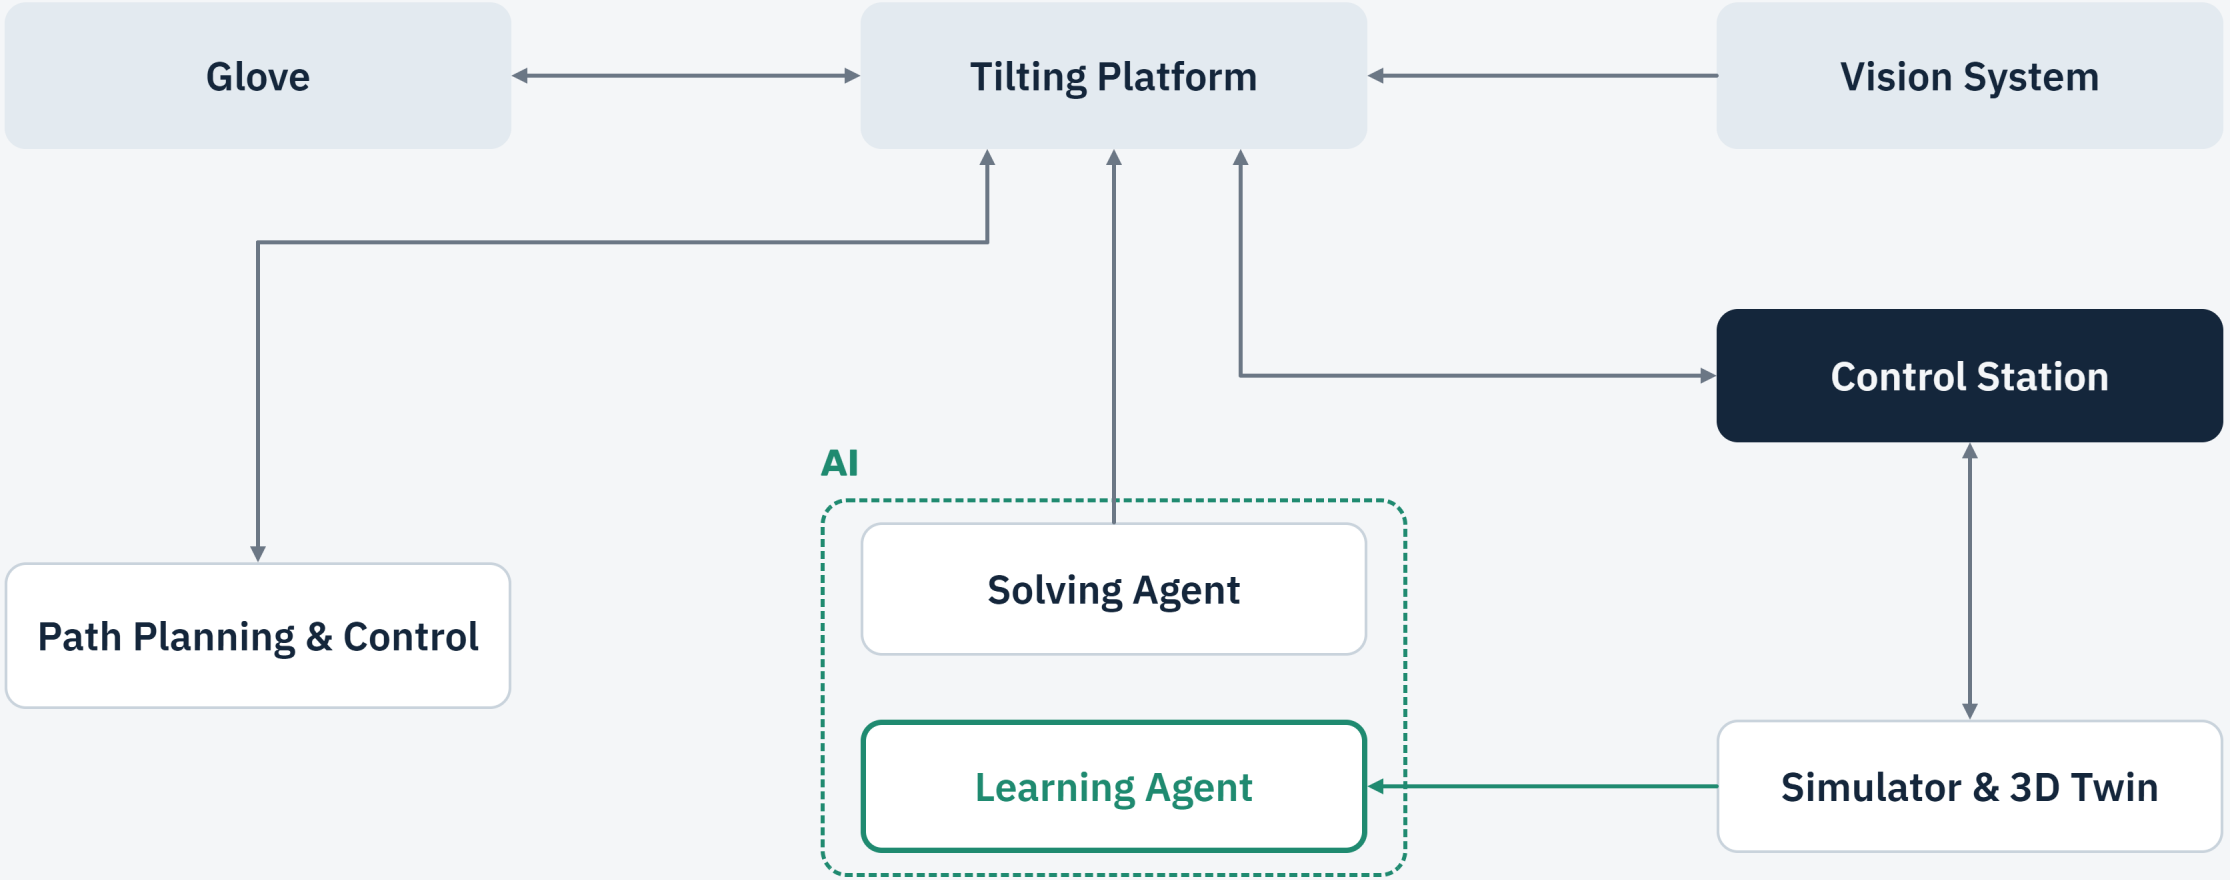

5 • End

The camera sees the ball fall into the exit. The time and the game log are saved.

6 • Learning

Saved player games train the AI. The AI then plays and is compared with the players.

System overview

SEVEN MODULES (1/2)

Modules A–C

A • Tilting Platform

- Maze tilted in two directions
- At least one exit hole
- Tilts only within safe limits

B • Glove

- Measures the tilt of the hand
- Sends it to the platform without cables
- Vibrates to warn the player
- Works on battery

C • Vision System

- Camera that sees the whole maze
- Finds the walls, start and exit
- Finds the ball’s position and speed
- Detects when the ball falls into the exit

SEVEN MODULES (2/2)

Modules D–G

D • Simulator & 3D Twin

- Computer model of the platform, maze and ball
- Used to train the AI
- Used to test software before the hardware is ready
- Shows the game in 3D

E • Path Planning & Control

- Calculates a path to the exit
- Tracks how far the ball has moved
- Moves the platform to the requested angle
- Simple solver for comparison with the AI

F • AI

- Learning Agent: learns from people’s games and in the simulator
- Solving Agent: plays on the real platform
- Compared with people and the simple solver

G • Control Station

- Start, stop and emergency stop
- Player mode and AI mode
- Live graphs, 3D model, settings
- Checks game rules, saves every game

Final demonstration

1. A player solves the maze using the glove.
2. The AI solves the same maze on the real platform, and its results are compared with the players and the simple solver.
3. The 3D model and the live graphs work during all games.

Thank you
